

Load the respective scene for an example of each of the six mechanical damage VFX. Alternatively, simply drag the Prefab for the required effect into your scene.

IMPORTANT: When using the sparking cables, for the rope physics to correctly function you'll need to update the TimeManager.asset for your Unity Project; go to the Project Settings menu via Edit -> Project Settings, then go to the Time section and change Fixed Timestep to 0.005 and Maximum Allowed Timestep to 0.02

To assist in placing the sparking cables in your scene, expand out the Cable Sparks GameObject in the Hierarchy window (click the small grey triangle next to it), then unhide the Shape_Guide GameObject (select it in the Hierarchy window, then tick it to activate it in the Inspector window on the right). This will give you a semi-transparent object of the size and shape of the cable. Remember to re-hide this guide when you're happy with its location in the scene.

Have fun!
